

Search Images Test Project

Basic requirements

The app should:

- Preferably be built with [TypeScript](#) + [React](#) + [Redux](#), preferably the latest version.
- Consist of 1 screen1:
 - Display screen which will display the images 10-15 items
- Images should be displayed in the "grid"-like view with a number of columns specified in the search screen.

Bonus/Additional features

Not essential, but nice to have:

- Some styling.

Some hints/clarifications

- It's okay (and might be easier)to simply send GET request to Google/Bing/DuckDuckGo and parse HTML, when searching for images, instead of using the corresponding Image Search API.
- It's good (and encouraged) to use any npm packages you can find/think of.
- If something is unclear or you have any additional questions, don't hesitate to submit an issue with your question.
- Create a GitHub repo with source code and give us a link.
